

Microsoft Copilot Cowork · Impact Report

What Cowork Did for Me

Jordan Rivera · Last 30 days (demo) (2026-08-19 → 2026-09-18) · Methodology v4

Report inspired from [“What I Did — GitHub Copilot Impact Report”](#) ↗

Time Saved

Research-anchored expert-equivalent effort

28.1h

Conservative **13.7h** Typical **28.1h** Optimistic **44.6h**

The sum of the published per-task time-saved bands across your sessions — every minute traces to a cited study.

Cost Reduction

Professional-services equivalent

\$2,670

Assisted value at expert rate — what a specialist would charge for the same deliverables

28.1h × your rate · range \$1,302–\$4,237

18

Cowork sessions

40

Tasks completed

18

Active days

28.1h

Expert-equivalent hours
delivered by Cowork

4.1h

Hands-on hours
your time (est.)

Secondary — speed multiplier: your ~28.1h of research-anchored expert-equivalent effort against an estimated ~4.1h of hands-on time is a **6.8×** multiplier. The expert clock is the sum of cited per-task time-saved bands; the assisted clock is a **modeled** estimate (OneDrive does not record keystroke time; measured where the telemetry hook is enabled), so treat the multiplier as directional, not a stopwatch.

Your projects — one view

Your projects

L 15 needed Cowork **M** 0 moderate fit (multi-file / automation) **3** a single Copilot could do it **0** insufficient evidence (rare — no basis)

All your projects in one table, each with a **Cowork-fit** dot — **H** needed Cowork · **M** moderate fit · **L** a single Copilot could do it · **?** insufficient evidence. **Hover any dot** for the specific reason. **Group by** process or category; the rows regroup in place, so you read the list once.

Value follows your hourly rate.

Group by

Project	Cowork-fit	Hours	Value
Technology & Engineering 3 projects		11.1h	40%
Debug and refactor the Python ETL pipeline that loads campaign telemetry into the warehouse		5.6h	\$532
Write a Python script to parse the survey exports and generate a CSV of NPS by segment		4.7h	\$446
Set up a recurring scheduled prompt to build my task list and schedule calendar events for launch week		0.8h	\$76
Finance & Business Value 3 projects		4.5h	16%
Build the ROI business case and cost analysis for migrating the reporting stack to Fabric		1.5h	\$142
Build the FY26 pricing model spreadsheet with tiered discounts and margin scenarios		1.5h	\$142
Benchmark and compare the three shortlisted CDP vendors against our requirements and cost		1.5h	\$142
Stakeholder & External Relations 2 projects		3.0h	11%

Synthesize the FY26 competitive landscape briefing from 7 analyst reports and our win/loss data

1.5h \$142

Prepare a meeting briefing from my calendar and the attendee LinkedIn profiles for the QBR

1.5h \$142

People & Talent Management2 projects

1.6h 6%

Synthesize the quarterly business review deck from the 6 regional performance reports

1.5h \$142

Triage the escalations Teams channel and post a summary of open blockers to the leadership chat

0.1h \$10

Customer Success & Support1 project

1.5h 5%

Triage my Outlook inbox, summarize the overnight threads and draft replies to the top 5 customer emails

1.5h \$142

Procurement & Vendor Management1 project

1.5h 5%

Summarize the long procurement email thread and draft a reply to the vendor with our decision

1.5h \$142

Analytics, Insights & Reporting1 project

1.4h 5%

Automate the weekly Power BI pipeline report as a recurring scheduled prompt with a Dynamics 365 connector

1.4h

\$133

Strategy & Planning1 project

1.2h

4%

Summarize the launch-readiness Teams channel and post an announcement to notify the team of the go/no-go

1.2h

Roles Cowork assembled for me

The professional roles Cowork stood in for — the specialist hats it wore so the work got done without added headcount — and **which project each went into. Projects run down the side** (most hours first), **roles across the top** (top 7 by hours; the rest fold into **Other**). A darker cell = more of that role's expert-hours in that project; the **Role total** row is the total time each role covered.

Project \ Role	Technical Writer	Software Engineer	Data Analyst	QA Engineer	Knowledge Worker
Debug and refactor Technology & Engineering		0.6	0.6	0.6	0.6

Per-deliverable hours = an equal share of its session's research-anchored expert time, so they sum back to the totals above. Chat-only sessions (no saved file) appear only in the role bars, not here.

Methodology & glossary

Every number above is traceable. Expand to see how each metric and band is derived — grounded in the Cowork Time-Savings Methodology v4 and its published sources.

How the time-savings bands are derived (per category) ▶

Analysis & Research 30 → **67** → 92 min/task

Stanford & World Bank 2025 (SSRN 5136877): mean of the 5 research-adjacent O*NET task categories (Critical Thinking 75, Active Learning 50, Quality Control Analysis 67, Judgement & Decision Making 51, Complex Problem Solving 92) = $335 \div 5 \approx 67$ min saved per task (Typical). LOW (30) = McKinsey 2023, 25–40% uplift on a ~60-min analytical task. HIGH (92) = Stanford-WB Complex Problem Solving ceiling.

Sources (slide 12): Stanford-WB SSRN 5136877 ↗ · OpenAI Deep Research ↗ · McKinsey 2023 ↗

Document & content creation 12 → **24** → 42 min/task

Microsoft Research causal-impact study (Verma, Suri & Counts 2026; difference-in-differences, $n=72,186$ Word users): ~6.1 min saved per Word activity instance × ~4 instances per doc run (draft → rewrite → format → polish) ≈ 24 min. Corroborated by UK GDS 2025 (~24 min/drafting task, $n=20K$).

Sources (slide 12): Microsoft Research 2026 (Verma · Suri · Counts) ↗

Email workflows 3 → **7** → 12 min/task

not used this period

Dillon et al., NBER w33795 (2025), RCT n=6,000+ across 56 firms: ~2 hr/week email savings ÷ 14.5 replies/week ≈ 7 min per substantive reply. LOW (3) = Noy & Zhang, Science 2023.

Sources (slide 12): Noy & Zhang, Science 2023 ↗ · NBER w33795 (Dillon 2025) ↗

Meeting workflows 12 → 31 → 43 min/task

Microsoft Work Trend Index Special Report 2023 (Study #2; Cambon et al., n=57 RCT): recap of a 35-min missed Teams meeting fell from 42m 34s to 11m 13s ≈ 31 min saved per recap (~3.8× faster).

Sources (slide 12): Cambon et al., MSR 2024 ↗ · Anthropic Agents 2024 ↗ · Forrester TEI 2024 ↗

Communication workflows 2 → 4 → 11 min/task

Microsoft Work Trend Index 2024: ~14 min/day on comms ÷ 5–7 micro-tasks ≈ 2 min/instance × 2 instances per run (rule + AI draft) ≈ 4 min.

Sources (slide 12): Microsoft WTI 2024 ↗ · NBER w33795 (Dillon 2025) ↗

Specialized workflows 10 → 25 → 40 min/task

Forrester TEI of Power Automate 2024: 200 hr/yr ÷ 250 days ÷ ~1.5 workflows/day ≈ 32 min/automation, trimmed to 25 (conservative). UK GDS 2025 corroborates ~10 min single-system admin tasks.

Sources (slide 12): Forrester TEI Power Automate 2024 ↗ · UK GDS Cross-Government 2025 ↗

Write or debug code 30 → 56 → 96 min/task

Cui, Demirer, Jaffe et al., CACM 2024 (n=4,867): ~18 min saved per coding step × 3 steps per run (write + test + debug) ≈ 56 min. Peng et al. RCT 2023 (55.8% faster) sets LOW; Stanford-WB 2025 sets HIGH (96).

Sources (slide 12): Cui et al., CACM 2024 ↗ · Peng et al. RCT 2023 (arXiv) ↗ · Stanford-WB SSRN 5136877 ↗

General assistance / Other 2 → 5 → 8 min/task

Brynjolfsson, Li & Raymond, QJE 2025 / NBER w31161 (n=5,179 agents) + Microsoft WTI 2024: ~5 min saved per single-turn assist/learn episode (no

chaining).

Sources (slide 12): Brynjolfsson, Li & Raymond QJE 2025 / NBER w31161

↗ · **Microsoft WTI 2024** ↗

Data basis: Derived from 18 Cowork session workspaces (input/output artifacts) saved to your OneDrive Cowork folder over the window, classified into the 8 methodology categories. Email, Meeting and Communication categories produced no saved artifacts this period, so they are reported as zero — this makes the totals a conservative floor of your true time saved.

What each metric means ▶

Cowork-fit (H / M / L)

How much a project needed Cowork, judged from the WORKFLOW evidence (what Cowork actually did — the apps its actions touched, sources reviewed and outputs), not just the file it saved, on a strict hierarchy. H (green) = two or more apps were in play (verified from the action trace or inferred from outputs/goal/related sessions, e.g. Outlook + Excel), OR the output shows code generation, an automation/workflow, multi-document synthesis, or multiple different output formats — none of which a single in-app Copilot does; an automation/workflow is never graded below High. M (yellow) = a moderate fit — a single-surface task that still reads two or more input formats or juggles a large number of files, or a light Cowork-platform op. L (red) = one app/output a single surface-specific Copilot (Excel, Word, PowerPoint, Outlook, Teams or chat) could have done, or a purely conversational task. ? (grey, rare) = insufficient evidence — reserved for a saved output of an unrecognized type with no code/automation/multi-format/cross-app signal and no action trace; a missing trace alone does not trigger it, as the grade is still inferred from outputs, goal and related sessions. Heuristic and directional - inferred where telemetry is absent.

Run task

One discrete thing you asked Cowork to do that maps to a single methodology category (e.g. build a deck, run an analysis, write a script). A session can contain several run tasks.

Typical band (min/task)

The research-anchored minutes-saved value the methodology applies per run task in a category. This report uses the deck's detailed per-category Typical values. Each Typical is computed as a per-instance figure from a published study $\times$ the typical number of instances in a Cowork run — not picked from a range.

Low / High band

The published floor and ceiling around each Typical. The report shows your total at Low, Typical and High so you can see the conservative-to-optimistic range.

Hours saved

Sum of (run tasks $\times$ the category's Typical minutes), converted to hours. Hours are fixed by the methodology and do not change with the hourly rate.

Professional-services value (USD)

Expert-equivalent hours $\times$ your hourly rate — the labour cost a firm would bill to produce the same work unassisted. Adjust the hourly rate at the top to recalculate every dollar figure live.

Expert clock (unassisted)

What a professional would take with no AI: the SUM of the research-anchored time-saved band for each task performed (e.g. Analysis 67 + Document 24 = 91 min typical). Every minute traces to a cited study — nothing is assumed for reading or authoring.

Assisted clock (your time)

A modeled estimate of your hands-on time with Cowork: a small fixed prompt/setup cost (~8 min/session) plus ~2 min per artifact handled. OneDrive does not record keystroke time, so this is an explicit assumption, not a measurement.

Speed multiplier

Expert clock $\div$ Assisted clock. '10 $\times$ ' means the same result would have taken an unassisted expert about ten times as long. Rate-independent.

Artifact

A concrete deliverable Cowork produced and saved to your OneDrive — a deck, document, spreadsheet, web page, script or package.

Active day

A calendar day on which you ran at least one Cowork session in the window.

Intent / collaboration style

How you were directing Cowork on each task — e.g. Researching vs. Building — derived from each task's category.

Skill augmented

The professional role the task draws on (Data Analyst, Engineer, Content Writer, etc.), with the hours Cowork covered for you in that role.

All research sources (clickable) ▶

Every Typical band is justified by the published sources cited on slide 12 of the Cowork Time-Savings Methodology deck. Click to open each.

How the speed multiplier & value are calculated ▶

(per session) = the sum of the research-anchored time-saved band for each task performed (e.g. Analysis 67 + Document 24 = 91 min typical). No read-time or authoring assumptions — every minute is a cited band.

(per session) = ~8 min prompt/setup + ~2 min per artifact handled
(modeled, not measured).

(secondary) = $\Sigma \text{Expert clock} \div \Sigma \text{Assisted clock}$. The assisted clock is a hands-on estimate (8 min + 2 min/artifact; measured where the telemetry hook is on), so the multiplier is directional — rate-independent.

= Expert-clock hours × your hourly rate (default \$95/hr). No ROI/seat-cost figure is shown because credit & seat consumption is not available.

The figures re-sum the published / band for each task.
